EDUCATION

NIIT University

Bachelor of Technology in Computer Science – 8.0 CGPA

Neemrana, IN

Aug. 2020 – Oct 2024

TECHNICAL SKILLS

Languages: C#, JavaScript, TypeScript, Python

Backend: ASP.NET Core, Node.js, NestJS, GraphQL, REST APIs

Frontend: React, Redux, Tailwind

Databases: PostgreSQL, MongoDB, MySQL, Redis

Cloud & DevOps: Azure DevOps, Docker, AWS SQS, Azure Blob Storage, CI/CD pipelines, Railway

Payments & Integrations: Stripe, Adyen, Forter, OAuth 2.0 (Google, Apple)

Monitoring & Tools: Git, Raygun, Sentry, Prisma, BullMQ

EXPERIENCE

Associate Software Developer

Feb 2025 – Present

CloudBoson Technologies Pvt. Ltd.

Noida, IN

- Contributed to building an in-house subscription management platform processing 100% of live transactions — including card, GPay, Apple Pay, Alipay, and PayPal — across 18+ currencies, 30+ gateways, and 6+ product domains, with Forter fraud detection and \$600K in projected annual savings.
- Developed dunning engine and chargeback automation workflows, implementing configurable retry schedules and automated customer notifications, recovering 60% of previously failed payments.
- Contributed to migrating 4,000 active subscribers from a third-party billing provider to an in-house platform — handling data model mapping, edge cases across paused and failed subscriptions, and zero-interruption cutover for live billing.
- Integrated Adyen for USD/global traffic and activated previously unsupported INR, PNS, CLP, and ARS currency plans via Stripe, unlocking new regional subscriber inflow and driving 100+ activations in the first month.
- Built brand-aware gateway retry logic that detects unsupported card brands and automatically reroutes through a configured fallback chain of alternative payment processors — reducing hard payment failures in production.
- Built a React-based Admin Control Portal managing 10,000+ user records, reducing manual operational effort by 30% through automated user state management and audit logging.
- Migrated legacy ASP.NET WebForms authentication to a React micro-frontend backed by an ASP.NET Core microservice, consolidating multiple login flows and integrating Google/Apple OAuth, increasing user activation by 20%.

Full Stack Developer Intern

Jan 2024 – June 2024

Dataphi Labs

Bengaluru, IN

- Developed an automated Resume Builder and course management UI for an LMS platform, supporting 500+ active users and 50+ courses driving a 30% increase in user engagement.
- Implemented role-based access control, input validation, and server-side rendered email and report templates for a freelance marketplace and a contract management system using React, Django, and PostgreSQL.
- Extended ERP modules for a Spare Parts Management System, adding custom frontend views, Jinja-based document templates, and backend logic in Python and PostgreSQL.

PROJECTS

Event Entry System | NestJS, TypeScript, PostgreSQL, Redis, BullMQ, Prisma, Railway

- Engineered a QR-based event check-in platform deployed on Sunmi scanning devices for a real event management company, replacing manual entry and reducing check-in errors to zero across 3 production events with 40–50 attendees each.
- Solved a dual-scan race condition by wrapping the entire check-in flow in a Prisma atomic transaction backed by a DB-level unique constraint, making simultaneous duplicate scans impossible at both application and database layers.
- Implemented SHA-256 hashed QR token system with JWT role-based access control (ADMIN/GUARD), offloading QR generation and notifications to a BullMQ async queue with exponential backoff retry, instrumented with Pino, Sentry, and Logflare for production observability.
